## Abstract and Index and Web Discovery Services IEEE Partners

### Introduction

This document is intended to provide a general overview of the abstract and indexing services and web discovery services that take in IEEE content. While this report is intended to provide readers with information on IEEE content indexed and in what service, there are several things to keep in mind:

- Services identified in this report do not cover everything in IEEE's Xplore Digital Library either because IEEE does not provide all content to these services, or because only certain content was selected by a partner.
- Some services add and delete titles regularly, or include only select articles, in order to maintain a database that is relevant to their audience. While IEEE may provide a data feed for a particular subscription package (noted in the tables below), partners are not required to index all content.
- Most partners update their products at varying intervals and many *Abstract and Indexing Services* **do not** include corrected or updated article information.

As a result, and given that these services and our agreements with these partners can and do change, readers of this report are encouraged to contact Krista Thom, Publishing Relations Program Specialist at [k.thom@ieee.org](mailto:k.thom@ieee.org) with specific questions.

### *Abstract & Indexing Services*

Abstract and indexing services maintain databases, often subject-specific, which users can search to find relevant content. The data included in these services may be peer-reviewed journals, books, reports, and other types of content. Unlike web scale discovery

services, these services collect metadata (including abstracts) from publishers and other organizations into large repositories or indexes. Search results often include abstracts or a brief summary of a research article that helps the user assess the relevance of the result. Most of these products give users the opportunity to view or purchase the full-text article at the publisher's website. Abstract and indexing services can include a wide breadth of information or can specialize in specific subject areas such as biosciences or humanities.

### *Web Scale Discovery Services*

Web scale discovery services develop commercial applications, usually geared toward institutional libraries. They allow library users to find locally and externally licensed content. Searchable content may include physical holdings (such as books and DVDs), local electronic content (such as digital image collections and institutional repository materials), and remotely hosted content purchased or licensed by the library (such as e-books and publisher databases). Through the use of link resolvers, users are able to access content on third-party sites.
